

MC1.2KW Power Amplifier

Introducing the McIntosh MC1.2KW Power Amplifier

The new MC1.2KW Power Amplifier from McIntosh joins a legendary family of monoblock designs, bringing impressive new front panel cosmetics to a robust 1,200 watt platform that boasts 200 amps peak output current capability.

A massive regulated power supply guarantees power to spare and the ability to drive any loudspeaker without regard to impedance or efficiency. The amplifier is balanced from input to output featuring a Quad-Differential configuration that, together with the patented McIntosh Output Autoformer, comprises a circuit that cancels virtually all noise and distortion. A giant hand-built wattmeter, set into the 1/2" thick glass front panel, provides accelerated peak-pausing response to ensure recognition of musical transients and fiber-optic illumination guarantees a lifetime of trouble-free performance. Sentry Monitor provides fuse-free automatic short circuit protection and Power Guard prevents loudspeaker-damaging clipping. Two balanced inputs simplify connection to the three-chassis, C1000 preamplifier. The MC1.2KW delivers full rated output power (1,200 watts), into 2, 4, and 8 ohm loads.

The MSRP of the new McIntosh MC1.2KW is \$11,000 (U.S. & Canada), and is scheduled to begin shipping in November.
